

Lawn Refresh

Drought Recovery Treatment

Benefits of Lawn Refresh

Lawn Refresh (Scarification) is a physical process to reduce the amount of thatch and creeping grasses within your lawn. It will help maintain a healthy growing environment above and below the soil surface, complemented by the addition of new seed to improve health and appearance.

What is thatch?

Thatch is a build-up of grass clippings, leaves and dead organic matter. This is common on most lawns, but very common on fine grassed/luxury lawns. We recommend scarification every 12-24 months, dependent on your grass species, fine luxury grasses require annual care.

Why Drought Recovery Lawn Refresh?

It's our proven care package to kick start your lawn keeping it vibrant, healthy into 2023 .

What is included in Lawn Refresh?

Overview: Scarification, Soil Improver and Over Seeding all the lawn .

Scarification to remove excess material and allows your grass the room to breathe. It also helps to manage moss and symptoms causing disease. Moss uses spores to breed, removing thatch and other cultural methods eg Aeration is the best way to discourage moss growth.

Over seed is sowing carefully selected professional seed into an existing lawn, a technique used by professional groundskeepers. It will rejuvenate your lawns colour and texture. Scarification creates the ideal environment for seed germination. The introduction of more desirable grass species which will become more prevalent, creating a thick uniform carpet of grass. Get the results of a new lawn!

Soil Improver will aid seed germination and recovery, it contains Gypsum and other natural micro nutrients to improve soil health, keeping the soil rich and healthy.
